1. App Description

🚧 BLDEASY — Full App Vision

One-liner (what it *is*)

BLDEASY is a smart connection platform that instantly matches customers with the *right* builder or trade — based on urgency, job type, and location — without the chaos of quotes, cold calls, or endless scrolling.

🎯 Core Problem You're Solving

Right now:

- Customers don't know **who to trust**
- Builders waste time on **low-quality leads**
- Platforms push **spammy quote wars**
- People just want *someone reliable, fast*

BLDEASY flips this → clarity, speed, relevance.

🧠 Core Philosophy

Connection > Competition

You are *not*:

- ❌ A quote-comparison site
- ❌ A booking platform
- ❌ A race-to-the-bottom marketplace

You *are*:

- ✅ A **connector**
- ✅ A **filter**
- ✅ A **trust layer**

🧩 How BLDEASY Works (User Flow)

👤 Customer Flow (Simple & Fast)

1. **Search or Ask AI**
    - "Bathroom renovation"
    - "Emergency plumber"
    - "Remove asbestos"
    - Or ask: *"Who do I need to fix a leaking roof?"*
2. **Quick Job Filters**
    - Urgency:
        - 🚨 Emergency (24–48h)
        - ⏱ Soon (1–2 weeks)
        - 🧱 Planned (1–6 months)
    - Job Type (dropdown / guided)
    - Location (auto GPS)
3. **Instant Matches**
    - Only *relevant* builders shown
    - No irrelevant trades
    - No spam
4. **View Profiles**
    - Past jobs

    - Service area
    - Response speed
    - Availability window
    - Contact options
    - Customers can post jobs with there specific needs
5. **Connect**
    - Call
    - Message
    - External website
    - No forced booking

👷 Builder / Tradesperson Flow

1. **Create Profile**
    - Trade category
    - Specialisation (e.g. “heritage homes”, “commercial fit-outs”)
    - Location radius
    - Typical job size
    - Urgency capacity
2. **Showcase Work**
    - Before/after photos
    - Short descriptions
    - Verified reviews (later phase)
3. **Pay to Be Listed**
    - Monthly / annual service fee
    - No per-lead bidding chaos
    - Optional featured placement
4. **Get Better Leads**
    - Only customers *already filtered*
    - Less time wasting
    - Higher conversion

🤖 BLDEASY AI (Your Secret Weapon)

AI for Customers

- “Do I need a builder or a plumber?”
- “Is this job urgent?”
- “What’s a realistic timeline?”
- “What trade fixes water damage?”

AI acts as a translator, not a contractor.

AI for Builders (Later Phase)

- Draft replies to customers
- Suggest job suitability
- Flag jobs that fit their specialty
- Profile optimisation tips

💸 Monetisation Model (Clean & Scalable)

Primary Revenue

- **Tradesperson Subscription**

- Basic Listing
- Pro Listing (featured, higher visibility)
- Enterprise (large companies / franchises)

Secondary Revenue (Later)

- Featured placements
- Sponsored categories
- Insurance / finance partners
- Renovation suppliers

⚠️ No pay-per-lead bidding = huge differentiator.

🔑 What Makes BLDEASY Different

Platform	Model	Problem
hipages	Quote bidding	Spam + race to bottom
Bark	Lead selling	Low quality leads
Google	Search	No filtering
BLDEASY	Smart connection	Relevant + fast

🧠 Brand Identity

Name

BLDEASY

- Builder
- Build
- Easy
- Memorable
- Short
- App-friendly

Tone

- Confident
- Straightforward
- No fluff
- "We just get it done"

Tagline Ideas

- *Build smarter. Connect faster.*
- *The easy way to find the right trade.*
- *No quotes. No chaos. Just builders.*
- *From problem to professional.*

🏗️ MVP Feature Set (What You Build First)

Must-haves:

- Customer search + filters
- Builder profiles
- Location matching

- Contact linking
- AI Q&A (basic)
- Subscription payments

Nice-to-have later:

- Reviews
- Job tracking
- Messaging
- Availability calendars
- Verification badges

🌱 Long-Term Vision

BLDEASY becomes:

- The **default entry point** for any home job
- A **trusted directory**, not a marketplace circus
- Expandable globally
- Extendable into:
    - Commercial
    - Strata
    - Insurance repairs
    - Property managers

App Pages:

1. Home / Search Page

Purpose: Allow customers to quickly find the right type of work or trade.

Features:

- **Search bar at the top**
    - Users can type keywords describing the job they need (e.g. *"emergency plumber"*, *"bathroom renovation"*).
- **Category icons under the search bar**
    - Main work categories (Builder, Plumber, Electrician, Removalist, etc.).
    - When a category is selected, it expands into **subsections** (e.g. Emergency Plumbing, Gas Fitting, Drainage).
- **Search preferences integrated into the search**

    - Materials required
    - Specific layouts or job requirements
    - Urgency level
    - Customer location

Bottom Navigation (TBC):

- Options under consideration:
    - Profile
    - Draft searches
    - Current searches/jobs
- Final navigation structure to be decided during UI design.

Builder Input:

- Builders define:
    - Main work categories
    - Subsections
    - Specialties
    - Location range
    - Availability level

These inputs directly affect search results.

---

2. AI Assist Page

Purpose: Help customers who are unsure what type of work they need.

Features:

- AI-powered assistant (specialised GPT-style model).
- Helps customers:
    - Identify the correct trade
    - Understand job urgency
    - Navigate the app
    - Receive **generalised cost guidance** (non-binding estimates).
- AI recommendations link directly to search results.

⚠️ AI does **not** provide binding quotes or act as a contractor.

---

3. Filters

Purpose: Refine search results to only the most relevant builders or trades.

Filters Include:

- Job type and subcategory
- Urgency (emergency / soon / planned)
- Availability
- Location
- Materials or job requirements

Filters work in conjunction with the search bar and AI Assist.

---

4. Results Page

Purpose: Display the most relevant builders or trades for the customer's job.

Features:

- Results are ranked by:
    - Job relevance
    - Urgency match
    - Location proximity
    - Availability
- **No sponsored rankings** — payment does not affect placement.
- Customers can:
    - View profiles
    - Contact builders directly
    - Save or like profiles

Recommendation Logic:

- Liked profiles may be boosted in future **recommended results** for similar jobs.

---

5. Builder Profile Page

Purpose: Allow builders to showcase their business and build trust.

Profile Layout:

- Company name at the top
- Image gallery (past work)
- Key job tags under images (e.g.):
    - “Emergency Plumber”
    - “All materials stocked”
    - “Available now”

    - “Sydney region”

Features:

- Company description
- Services offered
- Certifications and licences
- Verified credentials page
- Optional availability calendar
    - Customers **cannot book**
    - Calendar provides availability guidance only
- Status toggle:
    - Available
    - Limited
    - Not looking for work

Contact Box (Prominent):

- Phone number
- Website
- Email
- Build in chat system to message builder on app

---

6. Builder Sign-Up Page

Purpose: Onboard verified builders and trades.

Sign-Up Requirements:

- Upload:
    - Licences
    - Certificates
    - ABN
- Builders wait for approval to ensure platform trust.

After Approval:

- Builders receive a **license key**
- Access granted to:
    - Builder Dashboard
    - Customisable business profile

---

7. Builder Dashboard

Purpose: Give builders insight and control, not job management.

Features:

- **Analytics**
    - Profile views
    - Contact clicks
    - Traffic sources
- **Profile Management**
    - Edit descriptions, photos, specialties, availability
- **AI Insights**
    - What features drive the most traffic

    - Availability impact
    - Work area performance
- **Settings**
    - Subscription status
    - Billing
    - Plan changes
    - Support contact
    - FAQ access

---

8. Payments

Purpose: Monetise the platform once demand is proven.

Pricing Strategy:

- Builders are **free at launch**.
- Charging begins once either:
    - 2,000 users are reached, **or**
    - 100 searches per week are reached.

Pricing Model:

- **Foundation Members:**
    - $29 per month (early adopters)
- **New Builders:**
    - $49 per month

⚠️ Payment does **not** affect ranking or visibility.

---

9. Customer job page

- Customers can publish work descriptions they need done (including budget, urgency , location)
- Builders can check if it matches them and contact the customer

Summary

BLDEASY is designed to:

- Prioritise **relevance over payment**
- Build **trust between customers and builders**
- Act purely as a **connection platform**
- Avoid bidding, quoting wars, or pay-to-win rankings

App Layout:

Bottom navigation:

1. Home/ search page
2. Ai assist
3. Saved activity/ search
4. Customer/ Builder profile

Top left navigation

1. Account personal details
2. Settings (privacy , notification , language)
3. Help and support (contact, FAQ , how the app works)
4. Legal (T & C , privacy policy , disclaimer)
5. Builder portal

3. Builder vs Customer Conditional Logic

Default Mode

- App opens in **Customer Mode**

If user is NOT a builder:

- Builder Portal shows:
    - “Join as a Builder”
    - Sign-up flow

If user IS a builder:

- Builder Portal opens:
    - Dashboard
    - Analytics
    - Profile editor

Top-Right Menu:

- **Switch to Builder Mode**
- **Switch to Customer Mode**

No separate apps. One account, two modes.

---

4. UX Spec (Developer-Ready Summary)

- App uses **persistent bottom tab navigation** with 4 tabs
- Bottom tabs are always visible
- Top-right overflow menu contains secondary actions
- Builder Portal tab is **conditional** based on account status
- No booking, quoting, or messaging required at MVP
- Rankings are **algorithmic only**, not paid
- AI Assist feeds directly into Search and Results

Checklist:

To do for app (General)

- **0) Product clarity (1–2 sessions)**
- Write the **MVP feature list** (only what must exist to launch)
- Define the **2 roles**: Customer vs Builder
- Define the **core flows**:
  - Customer posts a job → Builders view → Builder applies → Customer accepts → Review
- **1) Backend foundation (Supabase) — do this first**

1.1 Create Supabase project

- Create Supabase project
- Save environment variables (Supabase URL + anon key)
- Decide regions/settings

1.2 Design the database (tables + relationships)

- Create tables:
  - users (profile + role)
  - builder_profiles
  - jobs
  - applications
  - reviews
  - (optional later: messages, payments, files)
- Add:
  - primary keys, foreign keys
  - indexes (for faster queries)
  - enums/status fields (job status, application status)

1.3 Authentication

- Configure Supabase Auth (email/password to start)
- Decide if you need:
  - email verification
  - password reset
  - social login later

1.4 Security (RLS) — mandatory

- Turn on RLS for tables
- Write policies like:
  - users can read/update only their own profile
  - builders can update only their builder profile
  - customers can create/edit only their own jobs
  - builders can apply only once per job
  - builders can view jobs (public fields)
- Test policies with two accounts (builder + customer)

1.5 File storage (if needed early)

- Set up Storage buckets:
    - builder photos / license docs / job photos
- Add storage access rules (who can upload/view)
- **2) Frontend foundation (Expo / React Native)**

2.1 Project setup

- Create Expo app
- Install essentials:
    - navigation
    - supabase client
    - form/validation library (optional)
- Add env config safely

2.2 Auth screens + session handling

- Build:
    - signup
    - login
    - forgot password
- Persist session
- Role routing:
    - if role = builder → builder dashboard
    - if role = customer → customer dashboard
- **3) MVP features (build in this exact order)**

3.1 Customer flow first (because it creates supply for builders)

- Customer dashboard
- Post a job (form → insert to jobs table)
- View my jobs (list + status)
- View job applicants (pull from applications)

3.2 Builder flow second

- Builder onboarding/profile setup (builder_profiles)
- Browse jobs feed (query jobs)
- Job details screen
- Apply to job (insert to applications)
- View my applications (pending/accepted/rejected)

3.3 Acceptance + status logic

- Customer accepts builder
- Update:
    - applications.status = accepted
    - jobs.status = closed/assigned
- Ensure everyone sees correct states

3.4 Reviews (simple MVP)

- After job closed:

        - customer leaves review for builder
        - update builder average rating
    - **4) Cloud / deployment (once MVP works locally)**

4.1 App distribution

- Build test versions (TestFlight / internal Android testing)
- Fix device-specific bugs

4.2 Domain + website (optional early, needed before launch)

- Buy domain
- Simple landing page:
    - what it is
    - join waitlist
    - contact

4.3 Analytics + monitoring

- Add analytics (events like job_posted, applied, accepted)
- Error monitoring (crash reports)
    - **5) Post-MVP upgrades (only after MVP is stable)**
- Matching logic (location + trade + availability)
- Messaging (real-time chat)
- Verification (licenses, ABN, etc.)
- Payments (Stripe subscriptions / pay-per-lead)
- Admin dashboard (moderation + disputes)

    - Push notifications
